

STOP. LOOK. LIVE.

Safety Tips for Outdoor Projects

The most common cause of electrical injuries is contact with overhead power lines. Fortunately, most electrical accidents can be prevented. Before you begin any job, whether you're cleaning gutters or trimming trees, take a moment to look around. Always be aware of your surroundings, know where power lines and other utility equipment are located and stay as far away as you can. Be certain that ladders, long tools, aerial lifts and your body cannot come within 10 feet of any electric or utility equipment.

FirstEnergy[®]

*Ohio Edison • The Illuminating Company • Toledo Edison
Met-Ed • Penelec • Penn Power • Jersey Central Power & Light
West Penn Power • Mon Power • Potomac Edison*

Remember these three words to help you stay safe:

STOP

When working outside, be aware that electrical equipment poses risks – especially if you are using ladders, long tools or aerial lifts.

LOOK

Know where power lines are located and make a plan for completing your work safely.

LIVE

Make sure equipment cannot come within **10*** feet of any overhead power lines. Stay aware and stay safe.

**Transmission lines (larger lines with higher voltages) require greater distances.*
